

Highlights

- Uses Optical Character Recognition to scrape text from over 18,000 UK general election (2010–2019) leaflets.
- Focuses on instances of environmental and climate mentions in local election campaigns.
- Investigates variance between constituencies, parties, and election years.
- Creates a novel dataset containing word counts of political topic mentions.
- Results highlight that campaign variance is primarily driven by weather differences, student population, and employment composition.
